Office Action Summary	Examiner	Art Unit			
	DANIEL YABUT	3656			
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply					
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.  - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.  - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.  - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).					
Status					
1) Responsive to communication(s) filed on 12 De	ecember 2008.				
<i>,</i> —	Since this application is in condition for allowance except for formal matters, prosecution as to the merits is				
	closed in accordance with the practice under <i>Ex parte Quayle</i> , 1935 C.D. 11, 453 O.G. 213.				
diosed in addordance with the practice under E	in parte quayie, 1000 C.B. 11, 40	0.0.210.			
Disposition of Claims					
<ul> <li>4) Claim(s) 15-31,33-37 and 39-42 is/are pending in the application.</li> <li>4a) Of the above claim(s) is/are withdrawn from consideration.</li> <li>5) Claim(s) is/are allowed.</li> <li>6) Claim(s) 15, 16-31, 33-37,and 39-42 is/are rejected.</li> <li>7) Claim(s) is/are objected to.</li> <li>8) Claim(s) are subject to restriction and/or election requirement.</li> </ul>					
Application Papers					
9) ☐ The specification is objected to by the Examiner.  10) ☑ The drawing(s) filed on 12 December 2008 is/are: a) ☑ accepted or b) ☐ objected to by the Examiner.  Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).  11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.					
Priority under 35 U.S.C. § 119

## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

2. **Claims 15-42**,are rejected under 35 U.S.C. 103(a) as being unpatentable over European Patent, EP 0557603 A1, in view of Buyze, US Patent 3,730,304, and in further view of Shimazu et al., US Patent 5,526,905.

EP 0557603 A1 discloses a viscous torsional vibration damper, having two faces (Fig. 1), comprising a(n):

Re claim 15

- Annular damper housing (1), which can be non-rotatably connected with a machine shaft (at
   11)
- Damper housing surrounding a working chamber (7) for receiving a flywheel (near 7)
- Working chamber being filled with a viscous damping medium (line 2 of abstract) wherein at least one of the two faces of the torsional vibration damper carries a fan plate (15) with radially inner and radially outer cooling ribs (17), the cooling ribs being arranged on at least two concentric graduated circles of the fan plate (Fig. 2)

However, as to **claim 15**, while EP0557603A1 discloses the fan plate having cooling ribs, it does **not** expressly disclose the fan plate having cooling channels.

Buyze teaches the use of cooling channels (24b) for the purpose of providing a reducing weight and reducing manufacturing costs (C1 / L19-20; C2 / L25-27).

Regarding **claim 15**, it would have been obvious to one having ordinary skill in the art at the time of the invention to alternatively provide cooling channels, as taught by Buyze, in the device of EP0557603A for the purpose of providing a reducing weight and reducing manufacturing costs.

As to **claim 15** further, EP 0557603 A1 as modified above does **not** expressly disclose the radially inner cooling channels having different geometrical dimensions than the radially outer cooling channels.

Shimizu et al. teaches the use of radially inner cooling channels (21; Fig. 5) having different geometrical dimensions than radially outer cooling channels (22; Fig. 5) for the purpose of creating a pressure drop that in turn induces air flow through the spaces (C11 / L16-21), thus improving the efficiency of the device.

Regarding **claim 15**, it would have been obvious to one having ordinary skill in the art at the time of the invention to alternatively provide the radially inner cooling channels having different geometrical dimensions than the radially outer cooling channels, as taught further by Shimizu et al., in the device of EP0557603A as modified above for the purpose of creating a pressure drop that in turn induces air flow through the spaces, thus improving the efficiency of the device.

EP0557603A1 as modified above further discloses the following:

Re claim 15

- Cooling channels formed between closed arched surface features (on 24b; Buyze) formed from the fan plate (C2 / L14-23). Note: The arched surface features are closed by legs 38, 40 joined to the fan plate 22 forming a cooling channel formed there-between.
- Radial length (C15 / L5-6; Shimizu) and a width (C9 / L26) of the radially outer cooling channels (21) is greater than a ratio of the radially inner cooling channels (22)

As to claims 17, 21-23, 28, 33 and 39, EP0557603A1 does not expressly disclose the ratios being between 3.5 and 1, as recited in claims 17, 33 and 39, the angular distance between adjacent radially outer cooling channels being between 3 and 7 degrees, as recited in claim 21, the angular distance between adjacent radially inner cooling channels being between 5 and 15 degrees, as recited in claims 22 and 23, and the radial spacing of the cooling channels amounts to between 20% and 100% of the length of the cooling channels, as recited in claim 28.

Regarding **claims 17**, **21-23**, **28**, **33 and 39**, it would have been obvious to one having ordinary skill in the art at the time of the invention to provide the ratios being between 3.5 and 1, as recited in

claims 17, 33 and 39, the angular distance between adjacent radially outer cooling channels being between 3 and 7 degree, as recited in claim 21, the angular distance between adjacent radially inner cooling channels being between 5 and 15 degrees, as recited in claims 22 and 23, and the radial spacing of the cooling channels amounts to between 20% and 100% of the length of the cooling channels, as recited by claim 28, since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. **Note:**("[W]here the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation." In re Aller, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955). See MPEP 2144.05.)

As to **claims 18, 34 and 40**, EP0557603A1 does **not** expressly disclose the cross-sectional surface of the radially outer cooling channels being smaller than the cross-sectional surface of the radially inner cooling channels.

Shimizu et al., teaches the use of a cross-sectional surface (at 122N; Fig. 32) of the radially outer cooling channels (122) being smaller than a cross-sectional surface (121R) of the radially inner cooling channels (121) for the purpose of adequately allowing cooling air to flow through the spaces formed by the radially outer cooling channels (C21 / L9-13).

Regarding **claims 18, 34 and 40**, it would have been obvious to one having ordinary skill in the art at the time of the invention to alternatively provide the cross-sectional surface of the radially outer cooling channels being smaller than the cross-sectional surface of the radially inner cooling channels, as taught by Shimizu et al., in the device of EP0557603A1 as modified for the purpose adequately allowing cooling air to flow through the spaces formed by the radially outer cooling channels, thus promoting the efficiency of the device.

EP0557603A1 as modified above further discloses the following:

Re claim 19

 Radially inner cooling channels (121; Shimizu) being wider (at 121R) than radially outer cooling channels (at 122N)

Art Unit: 3656

Re claim 20

 An angular distance a between adjacent radially outer cooling ribs (near 17; Fig. 2, upper region) is smaller than an angular distance of the radially inner cooling ribs (near 17; Fig. 2, lower region).

As to **claim 24**, EP0557603A1 does **not** expressly disclose at least one of the radially outer and radially inner cooling channels being oriented at an angle of slope  $\beta \le 30$  degrees with respect to their radial lines.

Shimazu et al. teaches the use of radially outer and radially inner cooling channels being oriented at an angle of slope  $\beta \le 30$  degrees (Fig. 19; C14 / L42-43, L48-50) with respect to their radial lines for the purpose of narrowing the stagnation area to form a wide main stream area (C5 / L30-35), thus improving the cooling efficiency of the device (C15 / L56-62).

Regarding **claim 24**, it would have been obvious to one having ordinary skill in the art at the time of the invention to alternatively provide at least one of the radially outer and radially inner cooling channels being oriented at an angle of slope  $\beta \le 30$  degrees with respect to their radial lines, as taught by Shimazu, in the device of EP0557603A1 as modified above for the purpose of narrowing the stagnation area to form a wide main stream area, thus improving the cooling efficiency of the device.

EP0557603A1 as modified above further discloses the following:

Re claim 25

 The cooling ribs are situated on different radial lines R (see 17 at upper and lower regions in Fig. 2)

Re claim 26 and 27

 The radially inner cooling ribs are radially spaced with respect to the radially outer cooling ribs (see 17 at upper and lower regions in Fig. 2).

Re claim 29 and 30

Cooling channels with open ends on the radial side are formed in an arched manner (Fig. 9;
 Buyze) from a plane of their circular sheet metal blank (C2 / L26) and the cross-section of the

Art Unit: 3656

cooling channels being sinusoidal (Fig. 8) for the purpose of providing a simplified rib design resulting in a lighter and less expensive product (C2 / L25-27; C1 / L19-21).

Re claim 31

 An annular damper housing (1), which surrounds a working chamber (7) and to be filled with a viscous damping medium (line 2 of abstract)

- A fan plate (15) formed on at least one of two faces of the viscous torsional vibration damper (at 17), the fan plate having radially inner and radially outer cooling channels (24b; Buyze) arranged thereon in at least two concentric graduated circles.
- Cooling channels formed between closed arched surface features (on 24b; Buyze) formed from the fan plate (C2 / L14-23). Note: The arched surface features are closed by legs 38, 40 joined to the fan plate 22 forming a cooling channel formed there-between.
- Radial length (C15 / L5-6; Shimizu) and a width (C9 / L26) of the radially outer cooling channels (21) is greater than a ratio of the radially inner cooling channels (22)

Re claim 35

 Radially inner cooling channels (121; Shimizu) being wider (at 121R) than radially outer cooling channels (at 122N)

Re claim 36

An angular distance between adjacent radially outer cooling ribs (near 17; Fig. 2, upper region) being smaller than an angular distance of the radially inner cooling ribs (near 17; Fig. 2, lower region).

Re claim 37

- A heat transfer apparatus for use with a viscous torsional vibration damper (Fig. 1)
- A fan plate (15) operatively configured to be arranged on at least one of two face surfaces (at
   17) of the torsional vibration damper when in use
- The fan plate includes radially inner and radially outer arranged cooling ribs (17), the radially inner and radially outer arranged cooling channels (24b; Buyze) forming two concentric graduated circles on the fan plate (Fig. 2)

Art Unit: 3656

 Cooling channels formed between closed arched surface features (on 24b; Buyze) formed from the fan plate (C2 / L14-23). Note: The arched surface features are closed by legs 38, 40 joined to the fan plate 22 forming a cooling channel formed there-between.

 Radial length (C15 / L5-6; Shimizu) and a width (C9 / L26) of the radially outer cooling channels (21) is greater than a ratio of the radially inner cooling channels (22)

Re claim 41

 Radially inner cooling channels (121; Shimizu) being wider (at 121R) than radially outer cooling channels (at 122N).

Re claim 42

 An angular distance between adjacent radially outer cooling ribs (near 17; Fig. 2, upper region) is smaller than an angular distance of the radially inner cooling ribs (near 17; Fig. 2, lower region).

## Response to Arguments

Applicant's arguments with respect to claims 15, 17-31, 33-37 and 39-42 have been considered but are most in view of the new ground(s) of rejection.

In response to applicant's argument that the Buyze and Shimazu references are nonanalogous art, it has been held that a prior art reference must either be in the field of applicant's endeavor or, if not, then be reasonably pertinent to the particular problem with which the applicant was concerned, in order to be relied upon as a basis for rejection of the claimed invention. See *In re Oetiker*, 977 F.2d 1443, 24 USPQ2d 1443 (Fed. Cir. 1992).

In this case, both of the prior art references address the particular problem with which the applicant is concerned. The above references and applicant's invention address the optimization of heat transfer for a rotating element for the purpose of cooling the device (Buyze, C4 / L16-17; Shimizu et al., C2 / L25-27) and can thereby be deemed as analogous art.

Art Unit: 3656

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should

be directed to DANIEL YABUT whose telephone number is (571)270-5526. The examiner can normally

be reached on Monday through Friday from 9:00 A.M. to 5:00 P.M. EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor,

Richard W. Ridley can be reached on (571) 272-6917. The fax phone number for the organization where

this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application

Information Retrieval (PAIR) system. Status information for published applications may be obtained from

either Private PAIR or Public PAIR. Status information for unpublished applications is available through

Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC)

at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative

or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-

1000.
